Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Hindered Amine Light Stabilizers market for 2018-2023.

Hindered amine light stabilizers (HALS) are chemical compounds containing an amine functional group that are used as stabilizers in plastics and polymers.[1] These compounds are typically derivatives of tetramethylpiperidine and are primarily used to protect the polymers from the effects of photo-oxidation; as opposed to other forms of polymer degradation such as ozonolysis. They are also increasingly being used as thermal stabilizers.

Based on end-use industry, the packaging segment is expected to lead the HALS market during the forecast period. Due to stringent regulations, only FDA and EU approved HALS products are used in packaging applications. This is done to protect consumers from harmful contamination by compounds inadvertently from contact materials into the food, thereby protecting delicate colours, flavours, vitamins, and nutrients of foods and beverages. Such attributes are expected to fuel the demand for HALS products.

The Asia Pacific region led the HALS market in 2017 and is expected to continue to lead during the forecast period, wherein China is a major consumer. The high demand for HALS is primarily due to the high demand from plastics producers and automotive manufacturers, which is expected to drive the market in the region.

Over the next five years, LPI(LP Information) projects that Hindered Amine Light Stabilizers will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
