In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Histidine market for 2018-2023.

Histidine is one of 22 amino acids derived from foods with high protein content, as well as certain grains. It is one of the aromatic amino acids that start out being an essential amino acid in human infants, but then later become a non- Acid as the body begins to synthesize it from imidazole, an organic compound and component of the aromatic ring in the acid's chemical structure.

Histidine, as one of 22 amino acids, is an important product. Currently, there are two producing process, such as fermentation method and hydrolysis method. Kyowa Hakko Bio and Ajinomoto produce histidine with fermentation method. Manufacturer in China tend to use hydrolysis method, also there production is limited.

Histidine has many applications such as pharmaceuticals, feed, food and other. In 2017, food consumed histidine amount was 559.5 MT, with a consumption share of 21.83%. Histidine consumed in pharmaceuticals and feed were separately 1516.2 and 393.1 MT in 2017.

Histidine production bases are concentrated in Japan and China. Kyowa Hakko Bio and Ajinomoto separately have their self-factory in Japan and China. In 2017, Japan produced about 1489.7 MT histidine, with a production share of 58.13%. As the second largest production region, Chinese histidine production was 1073.2 MT.

Over the next five years, LPI(LP Information) projects that Histidine will register a 6.6% CAGR in terms of revenue, reach US\$ 280 million by 2023, from US\$ 190 million in 2017.
