## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Hydroponics market for 2018-2023.

Hydroponics is a subset of hydroculture, the method of growing plants without soil, using mineral nutrient solutions in a water solvent. Terrestrial plants may be grown with only their roots exposed to the mineral solution, or the roots may be supported by an inert medium, such as perlite or gravel. The nutrients in hydroponics can come from an array of different sources; these can include but are not limited to byproduct from fish waste, duck manure, or commercial fertilisers.

In commercial hydroponic production, the primary hydroponic system used is the aggregate hydroponic system as most of the majorly used hydroponic growth techniques are a part of this system.

Europe has traditionally been at the forefront of implementing advanced techniques in hydroponic smart greenhouse horticulture. Countries such as The Netherlands, Spain, and France have large areas under greenhouse cultivation. However, in The Netherlands, growers mostly cultivate their plants in simple tunnel-like greenhouses without the use of climate control technologies. Hydroponics has flourished in Scandinavian countries where traditional agriculture is nearly impossible during the winter season.

Over the next five years, LPI(LP Information) projects that Hydroponics will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
