In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Hysteroscopic Endometrial Resection Procedures market for 2018-2023.

The process in which endometrial lining of the womb (uterus) is removed or destroyed is referred as hysteroscopic endometrial resection procedures. This procedure is also referred as transcervical resection of endometrium (TCRE). Hysteroscopic endometrial resection procedure is very effective treatment for the women with heavy menstrual bleeding and who has no longer desire for children. Hysteroscopic endometrial resection procedure is an alternative treatment for hysteroscopic surgery, which is an alternative treatment for heavy menstrual bleeding. Hysteroscopic endometrial resection procedure is more safe treatment than hysteroscopic surgery because it has significantly less complication and does not require the abdominal cut. Hysteroscopic endometrial resection procedure is a day surgery with a much shorter hospital stay. Besides that overall recovery period of the patient after surgery is much shorter than hysteroscopic surgery. During the hysteroscopic endometrial resection procedure, an operating telescope called resectoscope is passed into the uterus cervix. A special instrument is then passed through the telescope into the uterus for the removal of the womb lining. After hysteroscopic endometrial resection procedure, the womb is healed by scarring. Patient will be discharged from the hospital just 4-5 hours after the surgery.

Over the next five years, LPI(LP Information) projects that Hysteroscopic Endometrial Resection Procedures will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
