Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Ice Protection Systems market for 2018-2023.

Ice protection systems are designed to keep atmospheric ice from accumulating on aircraft surfaces (particularly leading edges), such as wings, propellers, rotor blades, engine intakes, and environmental control intakes. If ice is allowed to build up to a significant thickness it can change the shape of airfoils and flight control surfaces, degrading the performance, control or handling characteristics of the aircraft. An ice protection system either prevents formation of ice, or enables the aircraft to shed the ice before it can grow to a dangerous thickness.

The ice protection systems market in Europe is expected to witness the highest growth during the forecast period, as countries in Europe have been increasing their commercial fleet size due to increased air travel and passenger traffic and defense spending to strengthen their battle operational capacity. This is expected to consequently lead to increased demand of ice protection systems in the region.

Over the next five years, LPI(LP Information) projects that Ice Protection Systems will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
