Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global IGY Polyclonal Antibodies market for 2018-2023.

Immunoglobulin Y (abbreviated as IgY) is a type of immunoglobulin which is the major antibody in bird, reptile, and lungfish blood. It is also found in high concentrations in chicken egg yolk. As with the other immunoglobulins, IgY is a class of proteins which are formed by the immune system in reaction to certain foreign substances, and specifically recognize them.

IgY antibodies have a different structure from IgG, particularly in the Fc and hinge regions. The affinity maturation process of IgY is also different from IgG. These biological features underlie IgY's competitive advantages over IgG. Shown in the four panels are several comparisons between IgY and IgG.

IgY is a hen egg polyclonal antibody. Hen eggs contain more than 450 separate antibodies and when consumed, are not rejected by the human immune system. North America is the largest consumption place, with a consumption market share nearly 37.5% in 2017; Europe is the second largest consumption place with the consumption market share of 30% in 2017.

Over the next five years, LPI(LP Information) projects that IGY Polyclonal Antibodies will register a 13.5% CAGR in terms of revenue, reach US\$ 9 million by 2023, from US\$ 4 million in 2017.
