The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global In-memory Computing market for 2018-2023.

In-memory computing is the storage of information in the main random access memory (RAM) of dedicated servers rather than in complicated relational databases operating on comparatively slow disk drives. In-memory computing helps business customers, including retailers, banks and utilities, to quickly detect patterns, analyze massive data volumes on the fly, and perform their operations quickly. The drop in memory prices in the present market is a major factor contributing to the increasing popularity of in-memory computing technology. This has made in-memory computing economical among a wide variety of applications.

The In-Memory Computing Market has seen rapid adoption across verticals such as Banking, Financial Services, and Insurance (BFSI), IT & telecom, government, and retail, which has led to rapid growth of the market globally. IMC has a wide scope and finds acceptability across all verticals. Enterprises across all the verticals generate data and there is increased need to manage this organizational data to streamline business processes and achieve strategic initiatives.

Over the next five years, LPI(LP Information) projects that In-memory Computing will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
