In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Injectable Drugs market for 2018-2023.

Drug injection is a method of introducing a drug into the bloodstream via a hollow hypodermic needle and a syringe, which is pierced through the skin into the body. Injectable drugs bypasses first-pass metabolism in the liver, resulting in higher bioavailability and efficiency for many drugs (such as morphine or diacetylmorphine/heroin; roughly two-thirds of which is destroyed in the liver when consumed orally) than oral ingestion would, meaning users get a stronger (yet shorter-acting) effect from the same amount of the drug.

Over the next five years, LPI(LP Information) projects that Injectable Drugs will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
