Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Inorganic Pigment market for 2018-2023.

Inorganic pigments are chemical compounds not based on carbon, are usually metallic salts precipitated from solutions.

Inorganic pigments have a much larger average particle size than organic pigments. The optimum particle size needed to achieve maximum light scattering – resulting in opacity – is between 400 and 800 nm (wavelength). The particles sizes of inorganic pigments are much closer to this optimum than those of organic pigments, which tend to be much lower. This is the main reason why most organic pigments are considered transparent and most inorganic pigments opaque.

Over the next five years, LPI(LP Information) projects that Inorganic Pigment will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.

This report presents a comprehensive overview, market shares, and growth opportunities of Inorganic Pigment market by product type, application, key manufacturers and key regions.
