The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Integrated Graphics Processing Unit market for 2018-2023.

Integrated Graphics Processing Unit or integrated graphics processors (IGP) utilize a portion of a computer's system RAM rather than dedicated graphics memory. IGPs can be integrated onto the motherboard as part of the chipset, or on the same die with the CPU (like AMD APU or Intel HD Graphics). On certain motherboards AMD's IGPs can use dedicated sideport memory. This is a separate fixed block of high performance memory that is dedicated for use by the GPU.

The main benefit that integrated graphics deliver is affordability as laptops with discrete graphics can cost hundreds more. The combined workload also means less heat output and less power usage, which can translate to longer battery life. To enhance battery life, most laptops with discrete graphics on board switch to their integrated chips when not performing demanding tasks.

Over the next five years, LPI(LP Information) projects that Integrated Graphics Processing Unit will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
