Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global IP Security (IPSec) market for 2018-2023.

IPsec, also known as the Internet Protocol Security or IP Security protocol, defines the architecture for security services for IP network traffic. IPsec describes the framework for providing security at the IP layer, as well as the suite of protocols designed to provide that security, through authentication and encryption of IP network packets. Also included in IPsec are protocols that define the cryptographic algorithms used to encrypt, decrypt and authenticate packets, as well as the protocols needed for secure key exchange and key management.

IPsec can be used to protect network data, for example, by setting up circuits using IPsec tunneling, in which all data being sent between two endpoints is encrypted, as with a Virtual Private Network (VPN) connection; for encrypting application layer data; and for providing security for routers sending routing data across the public internet. IPsec can also be used to provide authentication without encryption, for example to authenticate that data originates from a known sender.

Over the next five years, LPI(LP Information) projects that IP Security (IPSec) will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
