In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Karl Fischer Titrators market for 2018-2023.

A Karl Fischer titrator, also known as a KF titrator, is used to determine the amount of water in a sample. Because the presence of water can affect many characteristics of a product, including reactivity, stability, and quality, KF titration is important to and is used in many industries. Food, oil, pharmaceutical, and semiconductor industries all use Karl Fischer titrators to maintain the quality of their products. There are two methods that can be used in Karl Fischer titration: volumetry, in which the amount of reagent that has been used determines the amount of water, and coulometry, in which an electrolysis reaction occurs and the amount of electricity used tells us the amount of water in the sample.

At present, this product is mainly used in the fields of food, medicine and petrochemical, of which the petrochemical industry is still the largest downstream and downstream application area. In 2016, the chemical industry accounted for more than 42.84% of consumption

At present, this product has been very common in the laboratory, replacement volume will dominate the entire market instead of new installed volume, therefore, manufacturers need to continue the development of new features, new models in order to grasp the market.

Over the next five years, LPI(LP Information) projects that Karl Fischer Titrators will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
