## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Kirschner Wires market for 2018-2023.

A kirschner wires (also called a K-wire) is a thin wire or pin that can be used to stabilize bone fragments. These wires can be drilled through the bone to hold the fragments in place. They can be placed percutaneously (through the skin), or can be buried beneath the skin.

Kirschner wires come in different sizes, and as they increase in size, they become less flexible. K-wires are often used to stabilize a broken bone, and then removed in the office once the fracture has healed.

The wires can also be threaded to help prevent movement or backing out of the wire, although that can also make them more difficult to remove.

Over the next five years, LPI(LP Information) projects that Kirschner Wires will register a 2.2% CAGR in terms of revenue, reach US\$ 31 million by 2023, from US\$ 28 million in 2017.
