Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Lab Bioanalysis Automation market for 2018-2023.

There have been a consensus in the bioanalytical industry that automation in bioanalytical laboratories improves sample throughput and data integrity, shortens method development time and sample data turnaround time. In addition, automation reduces tedious labor, occupational hazards, employee turnover and, in general, improves productivity. These factors all lead to benefits in drug development timelines and costing. Currently in bioanalysis, the bottleneck is mostly with the wet chemistry/sample preparation portion of the workflow, be it either sample preparation method development or sample preparation for routine analysis.

Much like the autosampler made large, automated, overnight LCMS/MS batch runs possible, the best way to improve bioanalytical wet chemistry productivity would be a commercially available, all-in-one 'bioanalytical wet chemistry kiosk' (BWCK), which every bioanalytical lab could afford. The BWCK would take some time to become a reality and perfect its functionalities; but even if the BWCK were available today, it would take a long time for it to phase into mainstream use and completely replace the current, large installed base of generic liquid-handling robots in production.

Over the next five years, LPI(LP Information) projects that Lab Bioanalysis Automation will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
