## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Laboratory Automation Workcells market for 2018-2023.

Laboratory automation is a multi-disciplinary strategy to research, develop, optimize and capitalize on technologies in the laboratory that enable new and improved processes. Laboratory automation professionals are academic, commercial and government researchers, scientists and engineers who conduct research and develop new technologies to increase productivity, elevate experimental data quality, reduce lab process cycle times, or enable experimentation that otherwise would be impossible. Automation workcells are special integrated systems in laboratories. These systems improve efficiency, reduce operational cost and time, minimize manpower involvement, and track the process from end-to-end with a single point entry and a disposal exit. The entire process of testing, verification, routing, scheduling, and disposal is all done within the system without any external operation. Automation workcells are available as both standardized products/off-shelf version and customized solutions to address different end-user requirements.

Over the next five years, LPI(LP Information) projects that Laboratory Automation Workcells will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
