In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Land Drilling Rigs market for 2018-2023. A drilling rig is a machine that creates holes in the earth's subsurface. Drilling rigs can be massive structures housing equipment used to drill water wells, oil wells, or natural gas extraction wells, or they can be small enough to be moved manually by one person and such are called augers.

Drilling rigs can be mobile equipment mounted on trucks, tracks or trailers, or more permanent land or marine-based structures (such as oil platforms, commonly called 'offshore oil rigs' even if they don't contain a drilling rig). The term 'rig' therefore generally refers to the complex equipment that is used to penetrate the surface of the Earth's crust. Small to medium-sized drilling rigs are mobile, such as those used in mineral exploration drilling, blast-hole, water wells and environmental investigations. Larger rigs are capable of drilling through thousands of metres of the Earth's crust, using large 'mud pumps' to circulate drilling mud (slurry) through the drill bit and up the casing annulus, for cooling and removing the 'cuttings' while a well is drilled.

Over the next five years, LPI(LP Information) projects that Land Drilling Rigs will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
