In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Laparotomy Sponges market for 2018-2023. A laparotomy sponge is an absorbent pad used in surgical procedures on the abdomen. They have a number of applications and are a common inclusion in surgical kits laid out to prepare an operating room for a surgery. Manufacturers typically produce several sizes in packages that may or may not come sterilized, allowing operating room technicians to select the most appropriate options for a given surgical case. Some manufacturers make sponges with radio-opaque tapes or strands of thread. The patient can be x-rayed to check for sponges before closing the surgical site, ensuring that any stragglers are caught and addressed. These features can also be useful when a patient has symptoms indicative of a retained sponge, like intense abdominal pain and tenderness; an x-ray can quickly determine if a laparotomy sponge is present or if something else is causing the problem.

Over the next five years, LPI(LP Information) projects that Laparotomy Sponges will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
