## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global LCD Glass market for 2018-2023.

“LCD glass substrate” is a generic term for the special glass used for thin-film transistor (TFT) LCDs which form the display area of products including LCD televisions, personal computers and mobile phones. An LCD panel consists of various components stacked in a number of layers. These components include a polarizer, a color filter and a liquid crystal layer, with the glass substrate being the most important. Glass substrates are extremely thin – typically about 0.3-0.7 mm – and 8th-generation glass substrates (2,200 x 2,500 mm) are as large as three tatami mats in size.

In order to accurately display beautiful, high-definition images, LCD glass substrates must have super-smooth surfaces with irregularities reduced to the nano-level. It is also necessary to avoid the formation of internal bubbles and the intrusion of foreign matter (dust) too minute for the naked eye.

Over the next five years, LPI(LP Information) projects that LCD Glass will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
