Abstracts

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global LDL Test market for 2018-2023.

LDL stands for low-density lipoprotein, a type of cholesterol found in the body. LDL is often referred to as bad cholesterol. This is because too much LDL results in a build-up of cholesterol in arteries, which can lead to heart attacks and strokes. High levels of good cholesterol, called high-density lipoprotein (HDL), may decrease risk of developing heart disease. HDL helps transport LDL cholesterol to liver to be broken down and thus helps avoid damage to heart. Doctor may order an LDL test as part of a routine exam to determine patient's risk for heart disease and decide if any treatment is necessary. Blood tests commonly report LDL-C: the amount of cholesterol which is estimated to be contained with LDL particles, on average, using a formula, the Friedewald equation. In clinical context, mathematically calculated estimates of LDL-C are commonly used as an estimate of how much low density lipoproteins are driving progression of atherosclerosis.

Over the next five years, LPI(LP Information) projects that LDL Test will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
