In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Leather and Allied Products market for 2018-2023.

Leather and allied product manufacturing establishments are engaged in tanning or curing of hide into leather and using it in the manufacture of footwear, handbags, purse and other leather products. It also includes the manufacture of similar products with substitute materials such as plastics, rubber or textiles.

In general, leather is produced in the following grades: Top-grain leather, Split leather, Patent leather and Bonded leather. Top-grain leather includes the outer layer of the hide, known as the grain, which features finer, more densely packed fibers, resulting in strength and durability. Depending on thickness, it may also contain some of the more fibrous under layer, known as the corium. Split leather is created from the corium left once the top-grain has been separated from the hide, known as the drop split. In thicker hides, the drop split can be further split into a middle split and a flesh split. Splits are often used to create suede. Split leather can also have a polyurethane or vinyl layer applied to the surface and embossed to give it the appearance of a grain, known as bicast leather, which is slightly stiffer than top-grain leather but has a more consistent texture. Patent leather is leather that has been given a high-gloss finish by the addition of a coating. Modern versions usually have a plastic coating, similar to bicast leather. Bonded leather, also called reconstituted leather, is a material that uses leather scraps that are shredded and bonded together with polyurethane or latex onto a fiber mesh. The amount of leather fibers in the mix varies from 10% to 90%, affecting the properties of the product.

Over the next five years, LPI(LP Information) projects that Leather and Allied Products will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
