In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Leprosy Treatment market for 2018-2023.

Leprosy, also known as Hansen's disease (HD), is a long-term infection by the bacterium *Mycobacterium leprae* or *Mycobacterium lepromatosis*. Initially, infections are without symptoms and typically remain this way for 5 to 20 years. Symptoms that develop include granulomas of the nerves, respiratory tract, skin, and eyes. This may result in a lack of ability to feel pain, which can lead to the loss of parts of extremities due to repeated injuries or infection due to unnoticed wounds. Weakness and poor eyesight may also be present.

The two main types of disease are based on the number of bacteria present: paucibacillary and multibacillary. The two types are differentiated by the number of poorly pigmented, numb skin patches present, with paucibacillary having five or fewer and multibacillary having more than five. The diagnosis is confirmed by finding acid-fast bacilli in a biopsy of the skin or by detecting the DNA using polymerase chain reaction. Over the next five years, LPI(LP Information) projects that Leprosy Treatment will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
