In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Lichen Nitidus Treatment market for 2018-2023.

Lichen nitidus is a chronic inflammatory disease of unknown cause characterized by 1–2 mm, discrete and uniform, shiny, flat-topped, pale flesh-colored or reddish-brown papules that may appear as hypopigmented against dark skin. Occasionally, minimal scaling is present or can be induced by rubbing the surface of the papules. The disease usually affects children and young adults and is painless and usually nonpruritic, although protracted itching may occur in some cases. It is sometimes referred to by dermatologists as 'mini lichen planus'.

Generally, lichen nitidus is asymptomatic and self-limited. Therefore, no treatment is required. However, if persistent pruritus is present, topical glucocorticoids may be tried. If the disease process is symptomatic, generalized and extensive, oral glucocorticoids may be indicated. Other reported treatments include PUVA, UVA/UVB phototherapy, astemizole, acitretin, and etretinate.

Over the next five years, LPI(LP Information) projects that Lichen Nitidus Treatment will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
