The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Light Electric Aircraft market for 2018-2023. An electric aircraft is an aircraft powered by electric motors. Electricity may be supplied by a variety of methods including batteries, ground power cables, solar cells, ultracapacitors, fuel cells and power beaming. They have since developed into small battery-powered unmanned aerial vehicles or drones, which in the twenty-first century have become widely used for many purposes.

Currently, battery-powered electric aircraft have much more limited payload, range and endurance than those powered by internal combustion engines. However, pilot training is an area that emphasizes short flights. Several companies make, or have demonstrated, light aircraft suitable for initial flight training. The advantage of electric aircraft for flight training is the lower cost of electrical energy compared to aviation fuel. Noise and exhaust emissions are also reduced compared with combustion engines.

Over the next five years, LPI(LP Information) projects that Light Electric Aircraft will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
