In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Marine Fuel Optimization market for 2018-2023.

Marine Fuel Optimization is a multi-level approach to measuring, monitoring, and reporting fuel usage on a boat or ship, with the goals of reducing fuel usage, increasing operational efficiency, and improving fleet management oversight. Marine Fuel Optimization has grown in importance due to the rising costs of marine fuel and increased governmental stresses to reduce the pollution generated by the world's fleet. Marine Fuel Optimization includes Throttle Optimization, Fuel Theft Detection, Tank Levels Monitoring and Bunker & Fuel Transfers, etc. Vessel operators have the most control over fuel usage by the way they use the engine(s) throttle. Wind, current, hull condition, load, and propulsion system health can all impact fuel burn both positively or negatively. Some modern fuel optimization systems are designed to perform these calculations while underway and make recommendations to the vessel master. In some parts of the world, fuel theft is an ongoing concern. Consequently, the accurate measurement of fuel taken on board coupled with the fuel actually consumed by engines and generators, is an important part of Marine Fuel Optimization. Over the next five years, LPI (LP Information) projects that Marine Fuel Optimization will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
