## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Material Jetting (MJ) market for 2018-2023. Material jetting is the equipment which could mold materials with material jetting technology. Material jetting has the added advantage of being able to 3D print using multiple materials at once. Objects can be produced with a variety of materials as well as customize the specific area where those materials are placed. This eliminates the need to print separate layers of different materials and assemble them later. In a single run, one can produce complete products with parts made from separate materials. In consumption market, North America and Europe are the mainly consumption regions due to the bigger demand of downstream applications. In 2016, these two regions occupied 92.19% of the global consumption volume in total.

The major raw materials for Material Jetting (MJ) are steel, resistor, capacitor, inductor, and other components. Fluctuations in the price of the upstream product will impact on the production cost of Material Jetting (MJ). The production cost of Material Jetting (MJ) is also an important factor which could impact the price of Material Jetting (MJ).

We tend to believe this industry is a rising industry, and the consumption increasing degree will show a smooth growth curve. And the price presents fluctuation according to the economy development status and international competition. Also, there is fluctuation in gross margin.

Over the next five years, LPI(LP Information) projects that Material Jetting (MJ) will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
