## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Mechanical Energy Storage market for 2018-2023.

Energy storage is becoming increasingly important, especially in energy-management schemes, because it provides the capability of using off-peak power, generated by highly efficient base-load units to supply peak-period demands. Peaking power is usually generated by those units on a utility system that are least efficient and more costly to operate.

So far, only pumped-hydro energy storage has been able to satisfy the high-capacity requirements of the electric utilities. But sites for such plants are becoming increasingly scarce or are being ruled out by environmental considerations, so other energy storage methods are being actively considered. In the field of mechanical energy storage, compressed air found a permanent place among other mechanical energy storage possibilities, such as flywheel for example, because it can be implemented on a large scale in the utility systems already today.

Over the next five years, LPI(LP Information) projects that Mechanical Energy Storage will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.

This report presents a comprehensive overview, market shares and growth opportunities of Mechanical Energy Storage market by product type, application, key companies and key regions.
