Melanoma, also known as malignant melanoma, is a type of cancer that develops from the pigment-containing cells known as melanocytes. Melanomas typically occur in the skin, but may rarely occur in the mouth, intestines, or eye. In women, they most commonly occur on the legs, while in men they are most common on the back. Sometimes they develop from a mole with changes such as an increase in size, irregular edges, change in color, itchiness, or skin breakdown.

Confirmation of the clinical diagnosis is done with a skin biopsy. It is usually followed up with a wider excision of the scar or tumor. Depending on the stage, a sentinel lymph node biopsy may be performed. Treatment of advanced malignant melanoma is performed from a multidisciplinary approach.
