In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Melt Blown Filter Cartridge market for 2018-2023.

Melt blowing is a conventional fabrication method of micro- & nanofibers. A polymer melt is thrust through small nozzles surrounded by high speed blowing gas. The fibers deposited in random form have various applications such as filtration, sorbents, apparels, and drug delivery systems. The advantage of melt blowing is simplicity, high specific productivity, and solvent-free operation. The porous non-woven melt-blown fabrics are used in the filtration process of gaseous and liquid materials. These applications include water treatment, masks, air conditioning filter, and others. Moreover, cartridges manufactured from a melt blown process offer excellent filtration and good thermal stability. The unique density gradient construction also aids in maximizing the efficiency and minimizing the pressure drop. In addition, this filter will not contribute to changing taste, odor, or color of the filtered product and has superior chemical resistance for process fluid applications.

Over the next five years, LPI(LP Information) projects that Melt Blown Filter Cartridge will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
