## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Metabolic Syndrome market for 2018-2023. Metabolic syndrome is a cluster of conditions — increased blood pressure, high blood sugar, excess body fat around the waist, and abnormal cholesterol or triglyceride levels — that occur together, increasing your risk of heart disease, stroke and diabetes. One of the upcoming trends gaining traction in the market is the increasing focus on oral insulin therapies. Till now, insulin injections were mostly administered through subcutaneous tissues, but this route of application is associated with risk of infection and hypersensitivity reactions, emboli, high cost, and injection site pain. Also, several needle-phobic individuals hesitate to adopt this route of administration. This paved the way for extensive research in the development of oral insulin. The oral form of insulin prevents the unpleasantness of insulin injections and other complications associated with the existing therapies. Moreover, oral administration of insulin ensures increased patient comfort and compliance, reduced risk of infection, simpler application, and is cost-effective.

Over the next five years, LPI(LP Information) projects that Metabolic Syndrome will register a 5.2% CAGR in terms of revenue, reach US\$ 33400 million by 2023, from US\$ 24600 million in 2017.
