Dermabrasion is a type of surgical skin planing, typically performed in a professional medical setting by a dermatologist or plastic surgeon trained specifically in this procedure. Dermabrasion has been practiced for many years (before the advent of lasers) and involves the controlled deeper abrasion(wearing away) of the upper to mid layers of the skin with any variety of strong abrasive devices including a wire brush, diamond wheel or fraise, sterilized sandpaper, salt crystals, or other mechanical means. Microdermabrasion uses tiny exfoliating crystals that are sprayed on the skin. It works best on problems such as dull skin, brown spots, and age spots. With microdermabrasion, skin is temporarily pink but fully recovers within 24 hours. It doesn't require surgery or anesthetics.

Over the next five years, LPI(LP Information) projects that Microdermabrasion will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
