In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Microsurgery market for 2018-2023.

Microsurgery is a general term for surgery requiring an operating microscope. The most obvious developments have been procedures developed to allow anastomosis of successively smaller blood vessels and nerves (typically 1 mm in diameter) which have allowed transfer of tissue from one part of the body to another and re-attachment of severed parts. Microsurgical techniques are utilized by several specialties today, such as: general surgery, ophthalmology, orthopedic surgery, gynecological surgery, otolaryngology, neurosurgery, oral and maxillofacial surgery, plastic surgery, podiatric surgery and pediatric surgery.

Free tissue transfer is a surgical reconstructive procedure using microsurgery. A region of 'donor' tissue is selected that can be isolated on a feeding artery and vein; this tissue is usually a composite of several tissue types. In addition, microsurgical techniques have played a crucial role in the development of transplantation immunological research because it allowed the use of rodents models, which are more appropriate for transplantation research. Moreover, microsurgery has been used to treat several pathologic conditions leading to infertility such as tubal obstructions, vas deferens obstructions and varicocele which is one of the most frequent cause of male infertility. Over the next five years, LPI(LP Information) projects that Microsurgery will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
