In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Microtomes market for 2018-2023.

A microtome (from the Greek mikros, meaning "small", and temnein, meaning "to cut") is a tool used to cut extremely thin slices of material, known as sections. Important in science, microtomes are used in microscopy, allowing for the preparation of samples for observation under transmitted light or electron radiation. Microtomes use steel, glass, or diamond blades depending upon the specimen being sliced and the desired thickness of the sections being cut. Steel blades are used to prepare sections of animal or plant tissues for light microscopy histology. Glass knives are used to slice sections for light microscopy and to slice very thin sections for electron microscopy. Industrial grade diamond knives are used to slice hard materials such as bone, teeth and plant matter for both light microscopy and for electron microscopy. Gem quality diamond knives are used for slicing thin sections for electron microscopy.

Compared to 2014, Microtomes market managed to increase sales by 4.87 to 4298 units in worldwide in 2015. Overall, the Microtomes performance is positive, despite the weak economic environment.

The technical barriers of Microtomes are high. The manufacturing bases relative concentration; some of the key players dominating this market like Leica, Sakura, Thermo Fisher etc..

The key factors driving the growth of the aforementioned industry are national attention to the development of scientific research and technology.

Over the next five years, LPI(LP Information) projects that Microtomes will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in

2017.
