In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Military Airborne Radar market for 2018-2023.

Radar is an object-detection system that uses radio waves to determine the range, angle, or velocity of objects. It can be used to detect aircraft, ships, spacecraft, guided missiles, motor vehicles, weather formations, and terrain. A radar system consists of a transmitter producing electromagnetic waves in the radio or microwaves domain, a transmitting antenna, a receiving antenna (often the same antenna is used for transmitting and receiving) and a receiver and processor to determine properties of the object(s). Radio waves (pulsed or continuous) from the transmitter reflect off the object and return to the receiver, giving information about the object's location and speed.

Airborne radar system is designed to detect aircraft, ships and vehicles at long ranges and perform control and command of battle space in an air engagement by directing fighter and attack aircraft strikes.

Over the next five years, LPI(LP Information) projects that Military Airborne Radar will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
