Minimally invasive surgery is performed without making a major incision or opening, resulting in fewer traumas for the patient and yielding significant cost savings. These are results of shorter hospitalization times and reduced therapy requirements. Other benefits of minimally invasive surgery are less pain, less need for postsurgical pain medication, less scarring, and less likelihood of complications related to the incision. Monitoring/visualization equipment allows surgeons and other operating room personnel to “see” the procedure being performed in the patient’s body through a specialized scope or on a video monitor.
