Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Mucormycosis market for 2018-2023.

Mucormycosis is any fungal infection caused by fungi in the order Mucorales. Generally, species in the Mucor, Rhizopus, Absidia, and Cunninghamella genera are most often implicated. The disease is often characterized by hyphae growing in and around blood vessels and can be potentially life-threatening in diabetic or severely immunocompromised individuals.

If mucormycosis is suspected, amphotericin B therapy should be immediately administered due to the rapid spread and high mortality rate of the disease.

Amphotericin B is usually administered for an additional 4–6 weeks after initial therapy begins to ensure eradication of the infection. After administration of either amphotericin B or posaconazole, surgical removal of the 'fungus ball' is indicated. The disease must be monitored carefully for any signs of reemergence.

Over the next five years, LPI(LP Information) projects that Mucormycosis will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
