Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Nano and Micro Satellite market for 2018-2023.

Nanosatellite refers to an artificial satellite with a wet mass between 1 and 10 kg. Designs and proposed designs of these types may be launched individually, or they may have multiple nanosatellites working together or in formation, in which case, sometimes the term 'satelliteswarm' or 'fractionated spacecraft' may be applied. Some designs require a larger 'mother' satellite for communication with ground controllers or for launching and docking with nanosatellites.

With continued advances in the miniaturization and capability increase of electronic technology and the use of satellite constellations, nanosatellites are increasingly capable of performing commercial missions that previously required microsatellites. For example, a 6U CubeSat standard has been proposed to enable a constellation of 35 8 kg Earth-imaging satellites to replace a constellation of five 156 kg RapidEye Earth-imaging satellites, at the same mission cost, with significantly increased revisit times: every area of the globe can be imaged every 3.5 hours rather than the once per 24 hours with the RapidEye constellation.

Over the next five years, LPI(LP Information) projects that Nano and Micro Satellite will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.

This report presents a comprehensive overview, market shares and growth opportunities of Nano and Micro Satellite market by product type, application, key
