In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Neurocutaneous Disorder market for 2018-2023.

Neurocutaneous Disorders are disorders that lead to growth of tumors in various parts of the body. They're caused by the abnormal development of cells in an embryo and characterized by the tumors in various parts of the body (including the nervous system) and by certain differences in the skin. While some can be diagnosed at birth, others don't produce symptoms until later in life. Although neurocutaneous disorders can't be cured, treatments can help manage symptoms and any health problems that occur. Common neurocutaneous disorders that affect kids include neurofibromatosis, sturge-Weber syndrome, tuberous sclerosis (TS), ataxia-telangiectasia (A-T) and von Hippel-Lindau disease (VHL). Symptoms vary widely from condition to condition, and they affect different kids in different ways. Often, the full effects of these diseases — even if detected at birth — don't emerge until a child grows up. The educational, social, and physical problems that the conditions cause must be managed throughout a child's life. Over the next five years, LPI(LP Information) projects that Neurocutaneous Disorder will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
