Neurosyphilis is an infection of the brain or spinal cord caused by the spirochete *Treponema pallidum*. It usually occurs in people who have had chronic, untreated syphilis, usually about 10 to 20 years after first infection and develops in about 25%–40% of those who are not treated. The United States' Centers for Disease Control and Prevention (CDC) advises that neurosyphilis can occur at any stage of a syphilis infection.

Neurosyphilis has four different forms: asymptomatic, meningovascular, tabes dorsalis, and general paresis. In rare instances, active neurosyphilis can mimic Alzheimer's disease. In addition to evaluation of any symptoms and signs, various blood tests can be done. Additional tests to look for problems with the nervous system may include Cerebral angiogram, Head CT scan, Lumbar puncture and MRI scan of the brain, brainstem, or spinal cord.
