The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Non-medical Infrared Thermometer market for 2018-2023.

An infrared thermometer (sometimes called IR Pyrometer) is a thermometer which infers temperature from a portion of the thermal radiation sometimes called black-body radiation emitted by the object being measured.
Non-medical Infrared Thermometer is a type of spot or point measuring instrument. A point measuring infrared thermometer should be used if users know where the critical point or the area to be measured is positioned within users' application. It is therefore possible to monitor the accurate temperature and optimize processes – if necessary – before quality problems arise.
The high tech IR measuring instrument is Infrared cameras, or also call IR imagers. This type of product is not included in this report, it is a type of area measuring method. Infrared cameras should be used in cases where more than one critical area exists or the area cannot be clearly defined. Critical areas can be localized by the camera through the demonstration of thermal images. The areas can then be permanently monitored by one or multiple fixed infrared thermometers.
Over the next five years, LPI(LP Information) projects that Non-medical Infrared Thermometer will register a 6.7% CAGR in terms of revenue, reach US$ 510 million by 2023, from US$ 350 million in 2017.
