In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Non-Sterile Compounding Pharmacy market for 2018-2023.

Nonsterile drug compounding is the practice of preparing specific medication doses for patients to drink, swallow, insert or apply to the skin. It is the most common kind of drug compounding done by pharmacists and pharmacy technicians in community and hospital pharmacies. And despite its 'nonsterile' designation, making customized dosages according to legal and professional standards requires adhering to strict rules for ensuring and maintaining active pharmaceutical ingredient purity and potency; ensuring the accuracy of mixing; providing proper packaging, storage, and labeling; and keeping all work surfaces and equipment as clean as possible.

Simple nonsterile compounding involves mixing medications according to established formulas, or 'recipes,' and creating liquid versions of drugs usually sold only as tablets or capsules. Pediatricians and veterinarians often request these kinds of products for babies and animals who cannot swallow pills or need doses smaller than ones in commercially produced products. Moderate nonsterile compounding involves making dosages containing potentially harmful medications or preparations that require special handling.

Over the next five years, LPI(LP Information) projects that Non-Sterile Compounding Pharmacy will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
