## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Organ Transplantation market for 2018-2023.

Organ transplantation is a medical procedure in which an organ is removed from one body and placed in the body of a recipient, to replace a damaged or missing organ. The donor and recipient may be at the same location, or organs may be transported from a donor site to another location. Organs and/or tissues that are transplanted within the same person's body are called autografts. Transplants that are recently performed between two subjects of the same species are called allografts. Allografts can either be from a living or cadaveric source.

Organs that have been successfully transplanted include the heart, kidneys, brain, liver, lungs, pancreas, intestine, and thymus. From year 2000 and forward, there has been approximately 2,200 lung transplants performed each year worldwide. From between 2000 and 2006, the median survival period for lung transplant patients has been 5-and-a-half years, meaning half the patients survived for a shorter time period and half survived for a longer period. In China, a kidney transplant operation runs for around \$70,000, liver for \$160,000, and heart for \$120,000. Although these prices are still unattainable to the poor, compared to the fees of the United States, where a kidney transplant may demand \$100,000, a liver \$250,000, and a heart \$860,000, Chinese prices have made China a major provider of organs and transplantation surgeries to other countries. In India, a kidney transplant operation runs for around as low as \$5000. Over the next five years, LPI(LP Information) projects that Organ Transplantation will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
