In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Orthodontic Headgear market for 2018-2023.

Orthodontic headgear is a type of orthodontic appliance attached to the patient's head with a neck strap or a number of straps around the head. The device typically transfers the force to the teeth via a facebow or J hooks to the patients dental braces or a palatal expander that aids in correcting more severe bite problems or is used in retention of the teeth and jaws of the patient.

Headgear is most commonly used to correct anteroposterior discrepancies. The headgear attaches to the braces via metal hooks or a facebow. Straps or a head cap anchor the headgear to the back of the head or neck. Other forms of headgear treat reverse overjets, in which the top jaw is not forward enough. It is similar to a facemask, also attached to braces, and encourages forward growth of the upper jaw. Headgear can also be used to make more space for teeth to come in. In this instance the headgear is attached to the molars, via molar headgear bands and tubes, and helps to draw these molars backwards in the mouth, opening up space for the front teeth to be moved back using braces and bands. Multiple appliances and accessories are typically used along with the headgear, such as: power chains, coil springs, twin blocks, plates or retainers, facemasks, a headgear helmet, etc.

Over the next five years, LPI(LP Information) projects that Orthodontic Headgear will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
