In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Parathyroid Disorders market for 2018-2023.

Parathyroid disorders lead to abnormal levels of calcium in the blood that can cause brittle bones, kidney stones, fatigue, weakness, and other problems.

Patients with chronic kidney disease may develop secondary hyperparathyroidism with resultant chronic kidney disease-mineral and bone disorder. Hypoparathyroidism most often occurs after neck surgery; it can also be caused by autoimmune destruction of the glands and other less common problems. Evaluation of patients with abnormal serum calcium levels includes a history and physical examination; repeat measurement of serum calcium level; and measurement of creatinine, magnesium, vitamin D, and parathyroid hormone levels. The treatment for symptomatic primary hyperparathyroidism is parathyroidectomy. Management of asymptomatic primary hyperparathyroidism includes monitoring symptoms; serum calcium and creatinine levels; and bone mineral density. Patients with hypoparathyroidism require close monitoring and vitamin D (e.g., calcitriol) replacement.

Over the next five years, LPI(LP Information) projects that Parathyroid Disorders will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
