Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Passport Reader market for 2018-2023.

A biometric passport is a traditional passport that has an embedded electronic microprocessor chip which contains biometric information that can be used to authenticate the identity of the passport holder. It uses contactless smart card technology, including a microprocessor chip (computer chip) and antenna (for both power to the chip and communication) embedded in the front or back cover, or center page, of the passport. The passport's critical information is both printed on the data page of the passport and stored in the chip.
Increase in the e-passports is rising the demand for passport readers at the airport terminals, hotels, and car rental service stations among others. These e-passports help in creating highly secure and interoperable infrastructure for international travel. Additionally, they reduce waiting time and benefit users by providing self-service kiosks, which enables the passengers to self-verify. However, one of the major restraining factors slowing down the growth of the passport readers market are the technical issues that occur in the device. The passport reader is an electronic device comprising electronic components, optical scanners, RFID, and others. Electronic components are highly sensitive to high voltage, which may damage them or may interfere with the proper working of the device.
Over the next five years, LPI(LP Information) projects that Passport Reader will register a xx% CAGR in terms of revenue, reach US$ xx million by 2023, from US$ xx million in 2017.
