Cancer peptide vaccination, as an immunotherapeutic approach against solid tumors, is currently employed in several clinical research protocols. The underlying mechanism of peptide-based vaccines involves the generation of a T-cell immune response against tumor or enhancement of an endogenous antitumor immunity pre-existing in the host. Cancer peptide vaccination, as an immunotherapeutic approach against solid tumors, is currently employed in several clinical research protocols. The underlying mechanism of peptide-based vaccines involves the generation of a T-cell immune response against tumor or enhancement of an endogenous antitumor immunity pre-existing in the host. With the ever increasing new cancer cases across the globe and the conventional treatment methods unable to cope up with the challenges posed by the tumor and their immune response evading techniques, cancer immunotherapy brings a ray of hope. Cancer immunotherapy allows the host's immune cells to get sensitized with the tumor-associated antigens which in turn elicits B cell and T cell mediated immune response to target and eliminate tumor cells. This is the underlying principle of cancer immunotherapy.

Peptide Cancer Vaccine can be used for Breast Cancer, Lung Cancer, Melanoma, Prostate Cancer and Others cancers. The most proportion research of Peptide Cancer Vaccine is about Melanoma, and the proportion in 2025 is about 40%.
