In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Personal Dosimeter market for 2018-2023.

Dosimeters are devices used to measure the amount of energy deposited by ionising radiation. This measurement is used to estimate the effective dose received by the human body through exposure to external ionising radiation. Dosimeters are utilized in places where people deal with hazardous waste or radioactive substances, such as hospitals, nuclear power plant.

Personal dosimeter is an electronic device that has a number of sophisticated functions, such as continual monitoring which allows alarm warnings at preset levels and live readout of dose accumulated. These are especially useful in high dose areas where residence time of the wearer is limited due to dose constraints. The dosimeter can be reset, usually after taking a reading for record purposes, and thereby re-used multiple times.

This report covers Pen Dosimeters and Direct Read Electronic Dosimeters. Due to the different technology, specifications and price level, non self-reading dosimeter thermoluminescent dosimeter (TLD) and optically stimulated luminescence (OSL) dosimeter are not covered in this report.

In the coming years there is an increasing demand for personal dosimeters in the regions of Asia Pacific and other developing countries that is expected to drive the market for more advanced personal dosimeters. Increasing of industrial fields expenditures, more-intense competition, launches in introducing new products, increasing of spending on general industry, retrofitting and renovation of old technology, increasing adoption of personal dosimeters will drive growth in global markets.

Over the next five years, LPI(LP Information) projects that Personal Dosimeter will register a 3.2% CAGR in terms of revenue, reach US\$ 250 million by 2023, from US\$ 210 million in 2017.
