Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Pharmaceutical Isolator market for 2018-2023.

Isolator systems are becoming increasingly important to the pharmaceutical industry. The improvement in product quality, the reduction of operating costs and the capability of longer production runs are significant advantages in comparison to conventional clean room production.

An isolator is a decontaminated unit, supplied with Class 100 (ISO 5) or higher air quality, which provides uncompromised, continuous isolation of its interior from the external environment (e.g., surrounding cleanroom air and personnel). There are two major types of isolators which are closed isolator operation and open isolator. "Closed isolator" systems exclude external contamination from the isolator's interior by accomplishing material transfer via aseptic connection to auxiliary equipment, rather than use of openings to the surrounding environment. Closed systems remain sealed throughout operations. "Open Isolator" systems are designed to allow for the continuous or semi-continuous ingress and/or egress of materials during operations through one or more openings. Openings are engineered (i.e., using continuous overpressure) to exclude external contamination from entering the isolator chamber.

Over the next five years, LPI(LP Information) projects that Pharmaceutical Isolator will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
