In this report, LP Information studies the present scenario (with the base year being 2017) and the growth prospects of global Point of Care Technology market for 2018-2023.

Healthcare information technology is a rapidly transforming area of opportunity for both physicians in the United States and the global healthcare community, promising to improve patient safety, save time for physicians and nurses involved in patient documentation, improve workflows, and enhance patient care outcomes by better enabling the flow of information within hospitals and individual practices, and throughout the healthcare system. The principle mechanism of achieving these outcomes over the next decade will be Point of Care (PoC) technology – the hardware and software used by nurses and doctors to facilitate improvements to the documentation, sharing and usage of patient information.

PoC technology encompasses the devices and systems that support health-care professionals in their daily activities of monitoring patients, caring for them, and documenting their health progress. The most important aspect of PoC technology is that it is present at the bedside. PoC technologies are used to facilitate and improve interactions between patients and their nurses, doctors, surgeons, and other medical advisors, leading to better healthcare outcomes. Point of Care technologies that give doctors and nurses access to the hospital's IT system are virtually limitless in their application for improving patient outcomes. Whether you're looking at a mobile PoC terminal that caregivers can move between patients, or a stationary installation that a triage nurse uses for patient intake, PoC devices have great versatility and software compatibility, enabling front-line medical staff to address their needs in the most

effective way.

Over the next five years, LPI(LP Information) projects that Point of Care Technology will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
