Polyps are abnormal tissue growths that most often look like small, flat bumps or tiny mushroom like stalks. Most polyps are small and less than half an inch wide. Most polyps are benign, meaning they're noncancerous. But because they are due to abnormal cell growth, they can eventually become malignant, or cancerous. Doctor can help determine if the growth is a polyp by performing a biopsy. This involves taking a small sample of tissue and testing it for the presence of cancerous cells.

The specific type of procedure used to obtain a sample will depend on where the polyp or polyps are located, as well as their size and number. The different procedures include colonoscopy for polyps located in the large bowel, colposcopy for polyps located in the vagina or cervix, eophagogastroduodenoscopy (EGD) for polyps located in the gastrointestinal tract and laryngoscopy for polyps located in the nose, throat, or vocal cords.
