Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In this report, LP Information covers the present scenario (with the base year being 2017) and the growth prospects of global Pool Grade Diatomaceous Earth market for 2018-2023.

DE is made from Diatomites, which are rough, porous fossilized mineral deposits formed near dried up water. The mineral is a result of dead single-celled algae called diatoms usually found in marine sediments. Diatoms account for ¼ of all photosynthesis on Earth. The size of each diatom is about the width of a human hair (0.5 mm). While some diatoms float by themselves, many diatoms group together and form suspended chains near the surface of water or attach themselves to rocks or plants under water. Pool grade (also called filter grade) diatomaceous earth is treated with very high heat in a process called calcination, which changes the silicon dioxide into crystalline silica. Pool grade DE is toxic and should only be used in filtration.

Over the next five years, LPI(LP Information) projects that Pool Grade Diatomaceous Earth will register a xx% CAGR in terms of revenue, reach US\$ xx million by 2023, from US\$ xx million in 2017.
